The reliability of the vehicle also depends on its mechanical conditions. Checking the vehicle before riding it, its regular maintenance and the use of **original Moto Guzzi spare parts** only are essential factors!

For information on the nearest **Official Dealer and/or Service Centre** consult our website: www.motoguzzi.com

Only by requesting Moto Guzzi original spare parts can you be sure of purchasing products that were developed and tested during the actual vehicle design stage. All Moto Guzzi original spare parts undergo quality control procedures to guarantee reliability and durability.

The descriptions and images in this publication are given for illustrative purposes only and are not binding. While the basic characteristics as described and illustrated in this booklet remain unchanged, Piaggio & C. S.p.A. reserves the right, at any time and without being required to update this publication beforehand, to make any changes to components, parts or accessories, which it considers necessary to improve the product or which are required for manufacturing or construction reasons.

Not all versions/models shown in this publication are available in all countries. The availability of individual versions should be checked with the Official Moto Guzzi sales network.

The Moto Guzzi brand is owned by Piaggio & C. S.p.A.

www.piaggio.com
This manual provides the main information to carry out regular maintenance operations on your vehicle. This manual is intended to Moto Guzzi Dealers and their qualified mechanics; several concepts have been deliberately omitted as they are considered unnecessary. As it is not possible to include complete mechanical notions in this manual, users should have basic mechanical knowledge or minimum knowledge about the procedures involved when repairing scooters. Without this knowledge, repairing or checking the vehicle may be inefficient or even dangerous. As the vehicle repair and check procedures are not described in detail, be extremely cautious so as not to damage components or injure individuals.

In order to optimise customer satisfaction when using our vehicles, Piaggio & C. s.p.a. commits itself to continually improve its products and the relative documentation. The main technical modifications and changes in repair procedures are communicated to all Moto Guzzi Sales Outlets and its International Subsidiaries. These changes will be introduced in the subsequent editions of the manual. In case of need or further queries on repair and check procedures, consult Moto Guzzi CUSTOMER DEPARTMENT, which will be prepared to provide any information on the subject and any further communications on updates and technical changes related to the vehicle.

NOTE Provides key information to make the procedure easier to understand and carry out.

CAUTION Refers to specific procedures to carry out for preventing damages to the vehicle.

WARNING Refers to specific procedures to carry out to prevent injuries to the repairer.

⚠️ Personal safety Failure to completely observe these instructions will result in serious risk of personal injury.

🔍 Safeguarding the environment Sections marked with this symbol indicate the correct use of the vehicle to prevent damaging the environment.

⚠️ Vehicle intactness The incomplete or non-observance of these regulations leads to the risk of serious damage to the vehicle and sometimes even the invalidity of the guarantee.

Vehicle identification

SERIAL NUMBER LOCATION
These numbers are necessary for vehicle registration.

NOTE
ALTERING IDENTIFICATION NUMBERS MAY BE SERIOUSLY PUNISHABLE BY LAW. IN PARTICULAR, MODIFYING THE CHASSIS NUMBER IMMEDIATELY voids the warranty.

FRAME NUMBER
The chassis number is stamped on the RH side of the headstock.
This number consists of numbers and letters, as in the example shown below.
ZGU KWA 000 MXXXXXX

Key:
ZGU: WMI (World Manufacturer Identifier) code;
KW: model;
A00: version variant;
0: free digit
G: variable year of manufacturer (G - for 2019)
M: production plant (M= Mandello del Lario);
XXXXXX: serial number (6 digits);

ENGINE NUMBER
The engine number is stamped on the left side, close to the engine oil level check cap.

INDEX OF TOPICS

MAINTENANCE

MAIN
Scheduled maintenance table

**NOTE**
CARRY OUT MAINTENANCE OPERATIONS AT HALF THE INTERVALS SPECIFIED IF THE VEHICLE IS USED IN PARTICULAR RAINY OR DUSTY CONDITIONS, OFF ROAD OR FOR TRACK USE.

**NOTE**
The times listed on the scheduled maintenance table include time dedicated to management activities.

I: INSPECT AND CLEAN, ADJUST, LUBRICATE OR REPLACE IF NECESSARY
C: CLEAN, R: REPLACE, A: ADJUST, L: LUBRICATE

(1): Replace if leaks occur
(2): Replace every 4 years
(3): At each engine start
(4): Check every month
(5): Check every 5,000 km (3,106 mi)
(6): Check and clean, adjust or replace, if necessary, every 1,000 km (621 mi)
(7): Replace when whichever of the following comes first: 40,000 km (24,855 mi) or 4 years
(8): At each service (except the first one), check if there is oil inside the filter box. If this is the case, clean it.

<table>

**NOTE**
AT EACH SCHEDULED MAINTENANCE MUST BE VERIFIED WITH THE DIAGNOSTIC TOOL IF THERE ARE ERRORS AND THE IF THE PARAMETERS ARE CORRECT.
ENSURE THAT THE VEHICLE CALIBRATION IS UP TO DATE AFTER UPDATING THE DIAGNOSTIC TOOL.

CAUTION

AFTER THE PROVIDED MAINTENANCE PROGRAM IS INDICATED TO PROCEED WITH THE MAINTENANCE OF THE VEHICLE STARTING FROM THE SERVICE OF 10,000 Km OR 10 MONTHS

Recommended products

Piaggio Group recommends the products of its "Castrol Official Partner" for the scheduled maintenance of its vehicles.

Use lubricants and liquids having specifications that are equivalent, or superior, to the recommended products. These indications also apply when topping up fluid levels.

<table>
<thead>
<tr>
<th>Product</th>

</tr>
</tbody>
</table>

Spark plug

- Unscrew and remove the screws (1)
• Remove the cover (2).

• Disconnect the spark plug cap (3)

• Unscrew the spark plug (4) and remove it

Check

• Keep the vehicle upright with both wheels on the ground.
• Unscrew and remove the cap/dipstick (1).
• The level is correct if the oil is close to the cap/dipstick opening (1).
• If the oil is lower than specified, top-up until it reaches the cap/dipstick hole (1).

CAUTION
Replacement

CAUTION
THE UNIT MUST BE HOT WHEN THE OIL IS CHANGED AS UNDER SUCH CONDITIONS OIL IS FLUID AND THEREFORE EASY TO DRAIN.

NOTE
RIDE SOME km (miles) TO WARM UP ENGINE OIL

- Place a recipient with a capacity of at least 400 cc (25 cu.in) under the drain plug (2).
- Unscrew and remove the drainage plug (2).
- Unscrew and remove the breather cap (1).
- Drain the oil into the container; allow several minutes for oil to drain out completely.
- Check and if necessary, replace the sealing washer of drainage plug (2).
- Remove any metal scrap attached to the drainage plug (2) magnet.
- Screw and tighten the drainage plug (2).
- Pour new oil through the fill opening until it reaches the cap/dipstick hole (1).

CAUTION
DO NOT ADD ADDITIVES OR OTHER SUBSTANCES TO THE FLUID. WHEN USING A FUNNEL OR ANY OTHER ELEMENT, MAKE SURE IT IS PERFECTLY CLEAN.

NOTE
THE RECOMMENDED QUANTITY OF OIL FOR REPLACEMENT IS 180 cc (10.98 cu in)

Recommended products
75W-140 lubricant for gearboxes and transmissions
Synthetic lubricant for gearboxes and transmissions
SAE 75W-140 - API GL5

- Screw and tighten the caps (1 - 2).

Check

Check the engine oil level frequently.

NOTE
CARRY OUT MAINTENANCE OPERATIONS AT HALF THE INTERVALS SPECIFIED IF THE VEHICLE IS USED IN PARTICULAR RAINY OR DUSTY CONDITIONS, OFF ROAD OR FOR TRACK USE.

THE OIL LEVEL MUST BE CHECKED WHEN THE ENGINE IS WARM.

CAUTION

DO NOT LET THE ENGINE IDLE WITH THE VEHICLE AT A STANDSTILL TO WARM UP THE ENGINE AND OBTAIN THE OPERATING TEMPERATURE OF ENGINE OIL. PREFERABLY CHECK THE OIL AFTER A JOURNEY OF AFTER TRAVELLING APPROXIMATELY 15 Km (10 miles) IN EXTRA-URBAN CONDITIONS (ENOUGH TO WARM UP THE ENGINE OIL TO OPERATING TEMPERATURE).

- Shut off the engine.
- Keep the vehicle upright with both wheels on the earth.
- Using the relative opening on the engine casing, check the oil level.

MAX (top notch) = maximum level.
MIN (bottom notch) = minimum level

- The level is correct if it reaches the "MAX" level.

Replacement

NOTE

HOT OIL IS MORE FLUID AND WILL DRAIN OUT MORE EASILY AND COMPLETELY.

- Remove the sump guard
- Place a collection container of suitable capacity under the drain plug (1).
- Unscrew and remove the drain plug (1).
• Unscrew and remove the filler plug (2).
• Drain the oil into the container; allow several minutes for oil to drain out completely.
• Check and if necessary, replace the sealing washer of drainage plug (1).
• Remove any metal deposits attached to the drainage plug (1) magnet.
• Screw and tighten the drainage plug (1).

DO NOT DISPOSE OF OIL INTO THE ENVIRONMENT.
DISPOSE OF ENGINE OIL IN A SEALED CONTAINER AND TAKE IT TO YOUR SUPPLIER OR TO THE NEAREST USED OIL COLLECTION CENTRE.

Engine oil filter

• Undo the two screws (1) and remove the cover (2).
• Remove the engine oil filter (3).
• Spread a thin layer of oil on the sealing ring of the new engine oil filter
• Fit the new engine oil filter with the spring facing downwards
• Refit the cover (2), screw and tighten the screw (1).

NOTE
NEVER REUSE AN OLD FILTER.

Replacement

NOTE
HOT OIL IS MORE FLUID AND WILL DRAIN OUT MORE EASILY AND COMPLETELY.
- Remove the sump guard
- Remove the manifold-terminal
- Place a container of suitable capacity under the drain plug (1).
- Unscrew and remove the drain plug (1).

- Unscrew and remove the filler plug (2).
- Drain the oil into the container; allow several minutes for oil to drain out completely.
- Check and if necessary, replace the sealing washers of drainage plug (1).
- Remove any metal deposits attached to the drainage plug (1) magnet.
- Pour in new oil, observing the quantity indicated in the “Capacity” table

**CAUTION**

DO NOT ADD ADDITIVES OR OTHER SUBSTANCES TO THE FLUID. WHEN USING A FUNNEL OR ANY OTHER ELEMENT, MAKE SURE IT IS PERFECTLY CLEAN.

**Air filter**

**REMOVAL**

- Remove the saddle
- Remove the glove compartment
- Remove the side fairing panels
- Unhook and remove the four springs (1) located around the airbox filter, two in the upper area, one on the left side and one on the right side
- Remove the filter box (2)

- Unscrew and remove the screws (3)

- Remove the cover (4).

- Remove the filter element (5)

DO NOT START THE ENGINE WITH THE AIR FILTER REMOVED. 
TO CLEAN THE FILTERING ELEMENT, USE A PRESSURISED JET OF AIR, AIMING IT FROM THE INSIDE OUTWARD.

Checking the valve clearance

If the timing system is very noisy, check the clearance between the valves and the rocking levers.

NOTE
ADJUST WITH COLD ENGINE, WITH PISTON AT TOP DEAD CENTRE (TDC) IN COMPRESSION STROKE (VALVES CLOSED).

- Initially check the valve clearance in the left cylinder, then remove the four fixing screws of the spark plug cover.

- Remove the spark plug cover.

- Remove the spark plug tube.

- Remove the three head cover fixing screws.
• Remove the head cover

• Remove the spark plug

**ALSO REMOVE THE SPARK PLUG OF THE RIGHT CYLINDER TO BE ABLE TO MANUALLY ROTATE THE ENGINE, ENGAGE THE FIRST GEAR AND TURN THE REAR WHEEL**

• Intercept the top dead centre checking that the rockers have clearance to be able to measure it

• Use a feeler gauge to check that the clearance between the valve and the set screw corresponds with the indicated values. The corresponding intake and outlet valve clearances are different than what is indicated below, proceed with adjusting them.

**Characteristic**

**Intake valve clearance**

0.10 mm (0.0039 in)

**Exhaust valve clearance**

0.15 mm (0.0059 in)

• Loosen the lock nut, adjust the clearance by acting on the adjuster until reaching the prescribed values

• Tighten the lock nut
To perform the valve clearance of the right cylinder, it is necessary to bring the cylinder to the top dead centre, rotating the engine 270 degrees.

Top-up

**FRONT BRAKE**

- Unscrew and remove the screws (1)

- Remove the cover (2).

- Remove the diaphragm (3) and the gasket (4)

- Top up
REAR BRAKE

- Undo and remove the screw (1)

- Remove the bracket (2)

- Unscrew and remove the cap (3)

- Remove the gasket (4)

RISK OF BRAKE FLUID SPILLING. DO NOT OPERATE THE BRAKE LEVER IF THE BRAKE FLUID RESERVOIR CAP IS LOOSE OR HAS BEEN REMOVED.

CAUTION
AVOID PROLONGED AIR EXPOSURE OF THE BRAKE FLUID. BRAKE FLUID IS HYGROSCOPIC AND ABSORS MOISTURE WHEN IN CONTACT WITH AIR. LEAVE THE BRAKE FLUID RESERVOIR OPEN ONLY FOR THE TIME NEEDED TO COMPLETE THE TOPPING-UP PROCEDURE.

⚠️ TO AVOID SPILLING FLUID WHILE TOPPING-UP, KEEP THE TANK PARALLEL TO THE RESERVOIR EDGE (IN HORIZONTAL POSITION).

DO NOT ADD ADDITIVES OR OTHER SUBSTANCES TO THE FLUID.

WHEN USING A FUNNEL OR ANY OTHER ELEMENT, MAKE SURE IT IS PERFECTLY CLEAN.

⚠️ WHEN TOPPING UP, DO NOT EXCEED THE "MAX" LEVEL. TOPPING UP TO THE "MAX" LEVEL MUST BE CARRIED OUT ONLY WITH NEW PADS. DO NOT TOP UP TO THE "MAX" LEVEL WITH WORN PADS BECAUSE THIS WILL CAUSE FLUID TO LEAK OUT IN THE EVENT OF BRAKE PAD REPLACEMENT. CHECK BRAKING EFFICIENCY. IN THE EVENT OF EXCESSIVE BRAKE LEVER TRAVEL OR A LOSS OF EFFICIENCY WITH THE BRAKING SYSTEM, THE BRAKING SYSTEM MAY NEED TO BE BLED.

### Clutch system

#### Adjusting the lever

It is possible to adjust the distance between the end of the lever (1) and the grip (2), turning the adjuster (3).

- Push the control lever (1) forwards and turn the adjuster (3) until the lever (1) is at the desired distance.
- Turning the adjuster anticlockwise, the lever (1) gets closer to the grip (2).

Adjust the clutch when the engine stops or the vehicle tends to move forward even when clutch lever is operated and the gear engaged, or if the clutch "slides", resulting in acceleration delay considering the engine revs.

- In order to maintain a correct tension and an optimal clutch operation, it is necessary to check and if necessary provide tension to the cable:
  - Urban use every 1,000 km (621.37 mi)
  - Extra urban use every 5,000 km (3,106.86 mi)
- In any case, every time you detect that the clutch has disengaged before the standard factory setting.
To adjust, do the following:

- Loosen the ring nut (4)
- Turn the set screw (5) with straight handlebar until the empty travel corresponding to the fixed abutment on the handlebar is 2 mm (0.08 in)
- Push the clutch control lever placed on the gearbox towards the rear wheel
- Pull the clutch control lever placed on the gearbox towards the opposite side (as in "point 3") checking that the cable is not tightened.
- During the previous operation, check that the cable lug turns freely around its axis, regarding the clutch lever
- Tighten the ring nut (4), holding the adjuster nut (5) to prevent it from turning
- If after the adjustment it is not possible to ascertain the condition of “point 5”, contact an Authorised Moto Guzzi Dealer to verify the proper operation of the clutch control.
- If the adjuster stroke (5) is not sufficient to ensure the required clearance, contact an Authorised Moto Guzzi Dealer

Headlight adjustment

To carry out vertical adjustment of the light beam:

- Stand the motorcycle in a vertical position.
- Slightly loosen the headlight fixing screws (1) on both sides.
• Slightly loosen the headlight fixing screw (2), and move the light beam manually to the desired position.
• Once adjusted, tighten all the screws.

After adjusting:

NOTE
CHECK THAT THE LIGHT BEAM VERTICAL DIRECTION IS CORRECT.

For a quick check of the correct direction of the front light beam:

• Place the vehicle 10 m (32.81 ft) away from a vertical wall and make sure the ground is level.
• Turn on the low beam light, sit on the vehicle and check that the light beam projected to the wall is a little below the headlight horizontal straight line (about 9/10 of the total height).

Storing new keys

**NOTE**
 REGARDLESS OF THE LANGUAGE SET IN THE DASHBOARD FUNCTIONS, THE KEY PROGRAMMING PROCEDURE CAN ONLY BE VIEWED IN ENGLISH.

- To carry out the one or more key programming procedures, up to a maximum of four, you must connect the motorcycle to the diagnostic tool.
- Turn key to "ON" and insert the USER CODE where required.
- Carry out the self-diagnosis of the dashboard and enter the “SETTINGS” section by clicking on “RESET KEYS”.

- At this point, a screen with a warning message will be visible. Press "OK" and start programming the keys.

**NOTE**
 IF THE IMMOBILIZER ANTENNA IS DISCONNECTED, YOU WILL NOT BE ABLE TO START KEY PROGRAMMING.

- Enter the USER CODE to continue.
- If the code entered is correct, the first key is stored.
At this point, on the digital display of the motorcycle, after the automatic restart of the dynamic presentation screen, a message will appear with a countdown of 20 seconds to insert the second key to be programmed.

- Set key to "OFF", insert the second key and set to "ON".

**CAUTION**

IF YOU DO NOT HAVE A SECOND KEY OR YOU DON'T WANT TO STORE ONE, THE DIAGNOSTIC TOOL WILL SHOW AN ERROR SAYING "1 KEY STORED"

- The second key is stored and you will be asked to enter the third key (if you have one). The same operation will be repeated to store the fourth key.
- To complete AND end the memorisation procedure, set key to "OFF".
- You should then test the correct functioning of all keys stored.

**Azzeramento icona manutenzione**

The system displays the function as follows:

- After the maintenance interval thresholds are exceeded (excepting the first), an icon with the adjustable wrench is shown on the digital display.

To reset Service proceed as follows:

- Connect the diagnostic tool;
- Select the concerned model;
- Enter in the "INSTRUMENT PANEL" section;
- Select "SELF-DIAGNOSIS";
- Select "ACTIVATIONS";
- Enable the command "SERVICE RESET".
Fuses

To check:

- Set the ignition switch to ‘OFF’ to avoid an accidental short circuit.
- Remove the saddle.
- Remove the fuse box cover.
- Take out one fuse at a time and check if the filament is broken.
- Before replacing the fuse, find and solve, if possible, the reason that caused the problem.
- If the fuse is damaged, replace it with one of the same current rating.

NOTE
IF THE SPARE FUSE IS USED, REPLACE WITH ONE OF THE SAME TYPE IN THE CORRESPONDING FITTING.

### MAIN FUSES

<table>

</table>
Control unit

REMOVAL

- Remove the saddle
- Unscrew and remove the screws (1)

- Disconnect the connectors (2)
- Remove the ECU (3)

NOTE
WHEN REASSEMBLING THE CONNECTORS, THE SLIDES MUST SLIDE FREELY UP TO THE LIMIT STOP, THUS FACILITATING THE CONNECTOR'S INSERTION. THE CATCH SHOULD SNAP INTO PLACE ONCE THE LIMIT STOP IS REACHED.

P160C Level 2 safety reset

Error cause:

- Due to the fact that the level 2 safety system (comparison between requested torque and calculated torque) detected a fault, the control unit reset the engine (severity C).

The instrument panel does not indicate the presence of this error even in the ATT status.

Troubleshooting:

- Perform the troubleshooting for the other detected errors

P1650 Engine events configuration Checksum calculation error
Error cause:

- Corrupt Flash-eeprom (hardware problem).
- Upload (e.g. in service) of an incompatible software version, therefore missing the reference check-sum.

This error is indicated by lighting up in a fixed manner the general warning light.

Troubleshooting:

- Call the Help Desk.

Can line

U0140 CAN line to the instrument panel

Electrical diagnosis:

- no signal.

Error cause:

- No signal is received from the instrument panel.

This error is indicated by lighting up in a fixed manner the general warning light.

Troubleshooting:

- Check the connector of the instrument panel: if not OK, restore; if OK, check the continuity of the two lines from the instrument panel connector to the VEHICLE connector of the Marelli control unit: if not OK, restore the cable harness; if OK, replace the instrument panel.

NOTE
THE PRESENCE OF THIS ERROR DETERMINE THE DEACTIVATION OF THE TRACTION CONTROL AND THE CRUISE CONTROL.

U1121 Diagnosis of "ABS control unit" CAN line or CLF frame counter

Functional diagnosis:

- Signal absent

Error cause:

- If there is no signal, no signal is received from the ABS control unit.

This error is indicated by lighting up in a fixed manner the MI warning light.

Troubleshooting:

- Missing signal - Perform the check procedure for pin 2 and 11 of the ABS control unit connector, for pin 66 and 80 of the Marelli control unit vehicle connector: if NOT OK, restore; if OK with key OFF, disconnect the ABS control unit connector; if NOT OK replace the wiring harness, if OK check the correct power supply to PIN 18 (12V) and the grounding of ABS control unit PIN 1; if NOT OK, restore the wiring harness, if OK, replace the ABS control unit.

NOTE
THE PRESENCE OF THIS ERROR DETERMINE THE DEACTIVATION OF THE TRACTION CONTROL AND THE CRUISE CONTROL.
Vehicle preparation

Before removing the engine from the vehicle, the following operations must be carried out:

- Place a suitable support under the vehicle and secure it using belts
- Remove the battery, the fuel tank, the rider footrest plates, the sump guard, the side stand, the complete exhaust system, the rear shock absorber and the side panels

Removing the engine from the vehicle

- Disconnect the connector (1)
- Disconnect the connector (2)
- Free the connector (2) from the wiring harness as illustrated in the figure
- Disconnect the connector (3)

- Unscrew and remove the screws (4)

- Remove the left headstock cover (5)

- Disconnect the connector (6)
• Remove the clamp (7)

• Unscrew and remove the screws (8)

• Remove the connectors box (9)

• Unscrew and remove the screws (10)
• Remove the injector cover (11)

• Undo and remove the screw (12)

• Remove the left injector (13)

• Remove the clamp (14)
• Unscrew and remove the screws (15)

• Remove the left intake fitting (16)
• Repeat the operations from "11" to "17" to remove the right inlet fitting

• Unscrew and remove the screws (17)

• Remove the starter motor cover (18)
• Lift the protective boot (19)

• Unscrew the nut (20) and remove it.

• Remove the cable (21)

• Disconnect the connector (22)
• Unscrew and remove the screws (23)

• Remove the starter motor (24).

• Disconnect the connector (25)

• Unscrew the nut (26) and remove it.
• Remove the cable (27) and (28)
• Unscrew and remove the screw (29)

• Remove the oil pressure bulb cover (30)

• Unscrew and remove the screw (31)
  • Remove the cable (32) from the oil pressure bulb

• Press the lever (33) toward the front part of the vehicle, as illustrated in the figure, to eliminate the tension to which the clutch cable is subjected
  • Simultaneously slide out and remove the clutch cable (34) from the points indicated in the figure
- Remove the clutch cable (34) from the cable grommet as indicated in the figure.

- Remove the clutch cable (34) from the engine and frame area.

- Disconnect the connector (35).

- Unscrew and remove the screws (36).
- Remove the cover (37).

### Removing

- Remove the rear view mirrors
- Remove the handguards
- Remove the front brake pump
- Remove the clutch pump
- Unscrew and remove the bushings (1) from both sides of the vehicle
• Remove the left hand grip (2)

• Unscrew and remove the screws (3)

• Remove the left-hand lights switch cover (4)

• Loosen the two screws (5)
• Unscrew and remove the screws (6)
• Loosen the screw (7)

• Remove the right-hand lights switch cover (8)

• Loosen the screws (9)

• Unscrew and remove the screws (10)
• Remove the U-bolt (11)
- Support the handlebar
- Remove the left-hand lights switch from the handlebar (12)

- Remove the throttle control from the handlebar (13)

- Remove the right-hand lights switch from the handlebar (14)

- Remove the handlebar (15)
Front fork

Removing the fork legs

The following procedure is described for a single fork stanchion, but is valid for both stanchions.

- Remove the front mudguard
- Remove the front wheel
- Loosen the screw (1)

- Loosen the two screws (2)

- Remove the fork stanchion (3)
Disassembling the fork

NOTE
THE STEMS ARE NOT THE SAME, THEREFORE THEY REQUIRE SEPARATE REMOVAL PROCEDURES.

THE FOLLOWING OPERATIONS APPLY WHEN REMOVING THE RIGHT HAND STEM

- Taking care not to damage it, secure the fork vertically in a vice, using the appropriate protection devices.
- Unscrew the upper cap (1).

Specific tooling
AP8140149 Guard for assembly operations

- Using the special tool (2), fastened to the pre-loading pipe (3), compress the spring and, with the assistance of a second operator, insert the separator plate (4) under the cap retaining nut (5).

Specific tooling
020888Y Preload tube clamp

AP8140148 Plunger-spacer separator plate

- Ensure that the cap (1) cannot rotate, and then loosen the nut (5).

- Unscrew and remove the cap (1).
• Extract the shaft (6) and remove it.

• After removing the locking plate and the device used to compress the spring, remove the upper plate (7) and the pre-loading pipe (3).

• Remove the spring (8) allowing the oil inside the stem to drip out.

• Drain the oil into a container having sufficient capacity, extending the stem several times in order to ensure the oil is drained completely.

DO NOT DISPOSE OF OIL INTO THE ENVIRONMENT. DISPOSE OF ENGINE OIL IN A SEALED CONTAINER AND TAKE IT TO YOUR SUPPLIER OR TO THE NEAREST USED OIL COLLECTION CENTRE.
• Taking care not to damage it, secure the sleeve horizontally in a vice, using the appropriate protection devices.
• Extract the dust guard (9).

**Specific tooling**
AP8140149 Guard for assembly operations

• Remove the seeger ring (10) from inside the sleeve.

• Pull the stem repeatedly towards yourself in order to remove it from the sleeve.

• Secure the stem in a vice and remove the plunger fastening screw (11), taking care not to lose the copper washer (12).
• Remove the complete plunger (13).

• Observing the indicated sequence, extract and remove the slider bushing (14), the guide bushing (15), the ring (16), the oil seal (17), the seeger ring (10) and the dust guard (9).

THE FOLLOWING OPERATIONS APPLY WHEN REMOVING THE RIGHT HAND STEM

• Taking care not to damage it, secure the fork vertically in a vice, using the appropriate protection devices.

• Unscrew the upper cap (1).

Specific tooling

AP8140149 Guard for assembly operations

• Ensure that the cap (1) cannot rotate, and then loosen the special nut (2).
• Unscrew and remove the cap (1).

• Unscrew the special nut (2) and remove it.

• Remove the buffer (3).

• Drain the oil into a container having sufficient capacity, extending the stem several times in order to ensure the oil is drained completely.

**DO NOT DISPOSE OF OIL INTO THE ENVIRONMENT. DISPOSE OF ENGINE OIL IN A SEALED CONTAINER AND TAKE IT TO YOUR SUPPLIER OR TO THE NEAREST USED OIL COLLECTION CENTRE.**
• Taking care not to damage it, secure the sleeve horizontally in a vice, using the appropriate protection devices.
• Extract the dust guard (4).

Specific tooling
AP8140149 Guard for assembly operations

• Remove the seeger ring (5) from inside the sleeve.

• Pull the stem repeatedly towards yourself in order to remove it from the sleeve.

• Observing the indicated sequence, extract and remove the slider bushing (6), the guide bushing (7), the ring (8), the oil seal (9), the seeger ring (5) and the dust guard (4).

Checking the components

Stem
Check that the sliding surface is not scratched or scored.
Any scoring can be removed by sanding with damp sandpaper (grain 1).
If the scratches are deep, replace the stem.

Using a dial gauge, check than any bending of the stem is below the limit value.

If it is over the limit, replace the stem.

**CAUTION**

*A BENT STEM SHOULD NEVER BE STRAIGHTENED SINCE ITS STRUCTURE WOULD BE WEAK-ENED MAKING THE VEHICLE DANGEROUS TO USE.*

**Characteristic**

**Bending limit:**

0.2 mm (0.00787 in)

**Sleeve**

Check for damage and/or cracks; if it is damaged, replace it.

**Spring**

Check the condition of the spring, making sure that the length is within the acceptable limits.

If not, replace the spring.

**MINIMUM LENGTH OF FREE SPRING: ... mm (... in)**

Check the condition of the following components:

- slider bushing;
- guide bushing;
- plunger.

If there is evidence of excessive wear or damage, replace the component concerned.

**CAUTION**

*REMOVE ANY IMPURITIES FROM THE BUSHINGS, BEING CAREFUL NOT TO SCRATCH THEIR SURFACES.*

Replace the following components with new ones:

- Oil seal.
- Dust guard.
- O-ring on the cap.

**Reassembling the fork**

**CAUTION**

*THE STEMS ARE NOT THE SAME, THEREFORE THEY REQUIRE SEPARATE MOUNTING PROCEDURES.*
THE FOLLOWING OPERATIONS APPLY WHEN MOUNTING THE RIGHT HAND STEM

- Observing the indicated sequence, extract and remove the dust guard (1), the seeger ring (2), the oil seal (3), the ring (4), the guide bushing (5) and the slider bushing (6).

- Insert the complete plunger (7).

- Secure the stem in a vice and, after inserting the screw (8) used to fasten the plunger, complete with the copper washer (9), apply the pre-defined tightening torque.

- Insert the stem in the sleeve.
• Using a suitable tool, complete with striking hammer, insert oil seal into its housing (3).

**Specific tooling**

AP8140189 Tool for fitting oil seal for 43 mm (1.69 in) diameter hole

AP8140146 Weight

• Position the seeger ring (2) inside the sleeve.

• Insert the dust guard (1) into its housing correctly.

• Place the fork stem vertically on a work surface.
• Fill the stem with the quantity of oil indicated in the "Refilling oil" section.
• Insert the spring (10), making sure that it is aligned correctly. The end where the spirals are more compressed should be facing upwards.

• Insert the pre-load tube (11), making sure that it is aligned correctly. The narrower part must be inserted into the spring.

• Insert the upper plate (12) on the pre-load pipe.

• After positioning the device (13) on the pre-load pipe (11) and the plunger support shaft (14), with the assistance of a second operator, raise the plunger so that it is possible to insert the plate (15) under the cap locking nut.

**Specific tooling**

020888Y Clamp for pre-load pipe

AP8140150 Bored shaft for bleeding plunger air

AP8140148 Plunger-spacer separator plate
• Insert the shaft (16) into the plunger.

• Before positioning the cap, adjust the hydraulic regulator screw so that the internal distance is as close as possible to 13 mm (0.51 in).

• Screw the cap (17) onto the plunger as far as it will go.

• Ensure that the cap cannot rotate, and then tighten the nut.
Tighten the cap on the sleeve, applying the pre-defined torque.

THE FOLLOWING OPERATIONS APPLY WHEN MOUNTING THE LEFT HAND STEM

- Observing the indicated sequence, extract and remove the dust guard (1), the seeger ring (2), the oil seal (3), the ring (4), the guide bushing (5) and the slider bushing (6).

- Insert the stem in the sleeve.

- Using a suitable tool, complete with striking hammer, insert oil seal into its housing (3).

Specific tooling

AP8140189 Tool for fitting oil seal for 43 mm (1.69 in) diameter hole
AP8140146 Weight
• Position the seeger ring (2) inside the sleeve.

• Insert the dust guard (1) into its housing correctly.

• Place the fork stem vertically on a work surface.
• Fill the stem with the quantity of oil indicated in the "Refilling oil" section.

• Insert the buffer (7).
• Insert the special nut (8) and tighten it as far as it will go.

• Insert the cap (9) and tighten it as far as it will go.

• Ensure that the cap cannot rotate, and then tighten the nut.

• Tighten the cap on the sleeve, applying the pre-defined torque.
Filling oil

THE FOLLOWING OPERATIONS APPLY WHEN MOUNTING THE RIGHT HAND STEM

- Place the fork stem vertically on a work surface.
- Fill the STEM with the indicated quantity of oil.

**WARNING**
OPERATE THE PLUNGER MULTIPLE TIMES UNTIL AIR BUBBLES MAY BE SEEN ON THE SURFACE OF THE OIL.

THE FORK MUST BE PERFECTLY UPRIGHT IN ORDER TO MEASURE THE CORRECT OIL LEVEL.

**Characteristic**
Quantity of oil for RH STEM
467 cm³ (28.50 cu in)

- Check the oil level from the rim of the sleeve.

**Characteristic**
Oil level (from sleeve rim, without the spring and with the pump all the way lowered)
129 mm (5.08 in)

THE FOLLOWING OPERATIONS APPLY WHEN MOUNTING THE LEFT HAND STEM

- Place the fork stem vertically on a work surface.
- Fill the STEM with the indicated quantity of oil.

**WARNING**
OPERATE THE PLUNGER MULTIPLE TIMES UNTIL AIR BUBBLES MAY BE SEEN ON THE SURFACE OF THE OIL.

THE FORK MUST BE PERFECTLY UPRIGHT IN ORDER TO MEASURE THE CORRECT OIL LEVEL.

**Characteristic**
Quantity of oil for LH stem
386 cm³ (23.56 cu in)
Installing the fork legs

The following procedure is described for a single fork stanchion, but is valid for both stanchions

- Insert the fork stanchion (1) into the upper and lower steering yoke holes

- Insert and tighten the screw (2)

- Insert and tighten the screws (3)

Removal

- Loosen the screws (1) from both sides of the steering yoke
• Unscrew and remove the screws (2)
• Remove the U-bolt (3)

• Unscrew and remove the fastening bushing (4)

• Undo and remove the screw (5)
• Remove all the wiring from the cable grommet
• Momentarily remove the handlebar, complete with controls, from the yoke

• Remove the steering yoke (6)
Removing

- Remove the upper steering yoke
- Remove the front mudguard
- Remove the front wheel
- Undo and remove the screw (1)

- Unscrew and remove the lower ring nut (2), using the special tool

- Remove the dust cover (3)

- Remove the dust seal ring (4)
- Remove the lower steering yoke (5) along with the fork stanchions
- Undo and remove the screws (6) and remove the fork stanchions (7)

**Steering bearing**

</tbody>
</table>
Adjusting play

- Remove the upper steering yoke
- Remove the safety washer (1)

- Unscrew and remove the upper ring nut (2), using the special tool

- Remove the rubber gasket (3)

- Adjust by tightening the lower ring nut to the prescribed torque
- With the front wheel lifted off the ground, turn the steering all the way right and left three or four times
- Check the tightening torque of the lower ring nut

NOTE

HANDLEBAR TURNING RESISTANCE SHOULD BE 250 ± 150 g IN BOTH DIRECTIONS
Refit the rubber gasket (3)

Mount the upper ring nut (2), manually tightening it more than 90° so that the necks of both ring nuts correspond with one another

Correctly reposition the safety washer (1)

Disassembling

- Remove the lower steering yoke

**UPPER STEERING BEARING**

- Remove the upper seat (1) of the upper steering bearing

- Using a generic bearing puller, remove the lower seat of the steering bearing as illustrated in the figure
LOWER STEERING BEARING

- Remove the lower steering bearing (4)

- Remove the lower seat (5) of the lower steering bearing

- Using a generic bearing puller, remove the upper seat of the lower steering bearing as indicated in the figure

Assembling

LOWER STEERING BEARING

- Using the appropriate punch, insert the upper seat of the lower steering bearing in the point indicated in the figure
• Insert the lower seat (1) of the lower steering bearing

• Insert the lower steering bearing (2)

**UPPER STEERING BEARING**

• Using the appropriate punch, insert the lower seat of the upper steering bearing as illustrated in the figure

• Insert the upper steering bearing (3)
• Insert the upper seat (4) of the upper steering bearing

### Shock absorbers

</tr>
</tbody>
</table>
Removing

- Blocking the nut (1)
- Undo and remove the screw (2)

- Undo and remove the screw (3)
- Retrieve the bushing (4)

- Remove the shock absorber (5)
Front wheel

**Removal**

- Place a support under the vehicle and secure it using belts so that the wheel can move freely and the vehicle does not fall.
- Remove the ABS sensor cable from the cable glands (1)

---

</table>
- Unscrew and remove the screws (2)

- Remove the ABS sensor (3) from the front right fork

- Unscrew and remove the screws (4)
- Remove the front left brake calliper (5) from the brake disc

- Unscrew and remove the screws (6)
- Remove the front right brake calliper (7) from the brake disc
• Loosen the screws (8)

• Loosen the screws (9)

• Unscrew the nut (10) and remove it.

• Retrieve the washer (11)
• Remove the wheel axle (12)

• Remove the front wheel (13)

• Retrieve the washer (14)

REMOVING THE FRONT BRAKE DISCS
The following procedure is described for a single brake disc, but is valid for both front brake discs.

• Remove the front wheel
• Unscrew and remove the screws (1)
• Remove the phonic wheel (2)

FRONT WHEEL BEARING REMOVAL

• Remove the front wheel
• Remove the dust cover (1)

• Using a generic bearing puller, remove the bearing as illustrated in the figure
• Repeat the entire operation from the opposite side of the wheel to remove the second bearing
Installing

• Insert the spacer (1)

• Place the front wheel (2) between the fork stanchions

• Insert the wheel pin (3)

• Insert the washer (4)
• Insert and tighten the nut (5)

• Tighten the screws (6)

• Tighten the screws (7)

• Correctly place the right front brake calliper (8)
• Insert and tighten the screws (9)
• Correctly place the right front brake calliper (10)
• Insert and tighten the screws (11)

• Position the ABS sensor (12) on the calliper mounting bracket

• Insert and tighten the screws (13)

• Insert the ABS sensor cable in the cable glands (14)
FRONT BRAKE DISCS INSTALLATION
The following procedure is described for a single brake disc, but is valid for both front brake discs.

- Place the front brake disc (1)

- Place the phonic wheel (2)

- Insert and tighten the screws (3)

FRONT WHEEL BEARINGS INSTALLATION

- Using an appropriate punch, install the wheel bearing as illustrated in the figure.
• Insert the dust cover (1)
• Rotate the wheel and repeat the entire operation from the opposite side of the wheel to install the second bearing

Rear wheel

Rimozione

- Undo and remove the screw (1)

- Holding the pin (3) in place, unscrew and remove the nut (2)

- Retrieve the washer (4)

- Remove the pin (3)
- Remove the brake calliper support plate (5) from the brake disc, complete with rear brake calliper

- Remove the rear wheel (6)

- Retrieve the bushing (7)

**FLEXIBLE COUPLING REMOVAL**

- Remove the rear wheel
- Remove the flexible couplings (1)
REMOVING THE REAR BRAKE DISC
• Remove the rear wheel
• Unscrew and remove the screws (1)
• Remove the phonic wheel (2)
• Remove the brake disc (3)

Installing
• Place the spacer (1) on the rear wheel

• Place the rear wheel (2) in the swing-arm

• Correctly place the rear brake calliper (3), complete with support bracket
• Insert the wheel pin (4)

• Insert the washer (5)

• Holding the pin (6) in place, tighten the nut (7)

• Insert and tighten the screw (7)
FLEXIBLE COUPLINGS INSTALLATION

- Remove the rear wheel
- Insert the flexible couplings (1) in the specific lodging

REAR BRAKE DISC INSTALLATION

- Remove the rear wheel
- Place the brake disc (1)
- Place the phonic wheel (2)
- Insert and tighten the screws (3)

**Removing**

- Removing the clamp (1)

- Unscrew the pin (2) and remove it.

- Unscrew the nut (3) and remove it

- Unscrew the pin (4) and remove it.
• Remove the swingarm (5)

Removing

• Remove the footrest plates
• Remove the rear wheel
• Remove the swingarm
• Strike a few times with a mallet to remove the cardan shaft (1)

Removing

• Unscrew and remove the screws (1)
Unscrew and remove the screws (2)

Remove the bevel gear (3)

Removal

- Undo the gearbox cover fixing screws

- Using the suitable special tool, heat the perimeter of the cover

Specific tooling
020151Y Air heater
• If available, use the threaded stud bolts as a guide to remove the cover. Turn the complete box and tapping it on a flat surface, remove the cover.

• Slide off the complete cover from the crown.

• Remove the crown axle thickness.

• Remove the inside spacer.
• Collect the washer.

• Remove the needle bearing.

• Using a suitable tool, disengage the radial snap ring.

• Remove the radial snap ring.
• Using the special tool, heat the seat of the outer track of the needle bearing.

**Specific tooling**
020151Y Air heater

• Insert the special tool under the washer and screw the cursor.

**Specific tooling**
001467Y036 Bearing internal cup extractor

• Insert a suitable bushing on the proper tool and screw the nut while holding the extractor.

• Remove the outer track of the needle bearing.
• Remove the washer.

• Remove the sealing ring. When reassembling use a new ring.

• Using a suitable tool, remove the radial snap ring.

• Using special tool, unscrew the ring nut. At the end of the thread, screw until it stops in such a way as to create the space between the same ring nut and the shoulder washer.

Specific tooling
020999Y Crown counter-lock ring wrench
• Insert the special tool under the shoulder washer and screw the cursor.

**Specific tooling**

19.90.70.00 Extractor for internal ring on drilled bolt

• Remove the inner track of the needle bearing.

• Remove the shoulder washer.

• Remove the ring nut.
• Remove the crown gear.

• Remove the cover from the gearbox of the splash guard hub.

• Remove the O-ring. When reassembling use a new O-ring.

• Rotate the cover and remove the seal ring. When reassembling use a new seal ring.
• Using special tool, unscrew the pinion bearings case.

Specific tooling
020998Y Pinion case wrench

• Remove the complete pinion from its seat.

• Using the special tool, lock in the vice, unscrew fastening nut and lock nut of the pinion case bearing.

Specific tooling
021000Y Bevel gear pair support

• Remove the spacer closing bearings.
• Remove the sealing ring.

• Remove the O-ring.

Checking

• After assembly of the box, it is necessary to check the play between the pinion and the crown. Clamp in a vice and install a dial gauge by means of a suitable support. The dial gauge tester must be placed the outer end of a tooth positioned at 90°.

Characteristic

Maximum clearance allowed

0.10-0.15 mm (0.004-0.006 in)
Assembling

- Insert the new O-ring in the pinion unit, or use the one removed during the dismantling phase if it is intact and undamaged

- Insert the seal ring until it stops

- Insert the spacer closing bearings paying attention that the manufactured part is facing the O-ring so as not to damage it

- Using the special tool, lock in the vice, screw the fastening nut and lock nut of the pinion case bearing to torque.

Specific tooling
021000Y Bevel gear pair support
• Insert the complete pinion in its seat.

• Using special tool, screw the pinion bearings case.

Specific tooling
020998Y Pinion case wrench

• Using the special tool, insert a new seal ring in the cover.
• On the opposite side of the cover, insert a new O-ring.
• Replace the sprocket hub cover.
• Replace the crown and the fastening ring nut.

Specific tooling
021005Y Punch seals on the bevel gear cover

• Screw the ring nut on the crown to the prescribed torque.
• Insert the shoulder washer. Using the special tool, insert the inner track of the needle bearing. Insert the radial snap ring.

**Specific tooling**

GU19927900 Punch for pressing bearing inner ring onto drilled pin

• Reposition the crown axle thickness.

**NOTE**
The thickness has a unique position in the box. Pay attention to the correct position by checking the correspondence of the holes with the fastening screws.

• Replace the complete cover of the hub in the box.

• Screw to torque the cover fixing screws.
Installing

- Insert the bevel gear (1) on the swing-arm

- Insert and tighten the fastening screws (2) to the prescribed torque

- Insert and tighten the fastening screws (3) to the prescribed torque

### Removing the tail pipe

**REMOVAL**

- Loosen the clamp (1)
• Block the nut (2) so that it cannot rotate and remove the screw (3)

• Remove the rear silencer (4)

Removing the manifold - tail pipe

• Remove the terminal
• Loosen the clamp (1)

• Loosen the clamp (2)
• Block the nut (3) so that it cannot rotate and remove the screw (4)

• Block the nut (6) so that it cannot rotate and remove the screw (5)

• Remove the central manifold (7)

Removing the exhaust manifold

• Disconnect the lambda probe connectors (1) from both sides of the vehicle
• Unscrew and remove the nuts (2) from both sides of the vehicle

• Remove the exhaust manifold (3)
Aria secondaria

key:
1. Air filter casing
2. Secondary air valve
3. Secondary air system pipe
4. Secondary air system inlets on the engine

- Two auxiliary air inlets have been included in the cylinder head which, in combination with the injection system with oxygen sensor and three-way catalytic converter, ensure compliance with severe new Euro 4 emissions regulations.
• Undo the screws fastening the reed valve cover.

• Remove the reed valve cover

• Remove the reed valve.

• Remove the flame trap.
• A valve controlled by the engine ECU is installed under the tank, which allows air to flow towards the cylinders via two flexible hoses.

• This valve is connected directly to the filter box via a flexible hose.

19. Front brake reservoir

ABS OPERATION

General specifications:
The front circuit is the same as the rear one.

- The ABS inlet valve (10 - 12) is normally open and it is closed only when the system intervenes to avoid wheel locking.
- The exhaust valve (13 - 15) is normally closed and it is opened only when the system intervenes to avoid wheel locking.
- With the system in stand-by mode, the ABS processor controls the wheel speed instant by instant to assess any slippage of the wheels.
- When in standby, the system does not intervene at all when the rider brakes; the braking system is the same as the one without ABS.

ABS Cycle phases (the following operations refer to the front circuit but they are also valid for the rear):
A - Brake activation: the rider starts braking as he would usually do.
B - Pressure reduction: coincides with the recognition of the dangerous situation (wheel slippage exceeds the threshold): the system closes the inlet valve (10-12) and opens the exhaust valve (13-15) temporarily.
At this stage the rider cannot increase the pressure on the callipers (8-9) and the system reduces the pressure on the callipers partially. The excess fluid temporarily fills the front reservoir (18-19) until the ABS pump (17) self-activates and delivers the fluid back to the brake pump (2-5).
C - Maintaining pressure: the pressure in the callipers (8-9) remains low until total recovery of speed / wheel grip.
The system restores the fluid taken from the calliper (8-9) in the section of the system between the brake pump (2-5) and the ABS inlet valve (10-12).

**D - Pressure restoration:** by opening the inlet valve (10-12) momentarily, the pressure of the callipers (8-9) is increased until maximum deceleration is reached. Then, the system gives the control over the braking back to the rider.

**E -** If the wheel does not reach complete grip, the system continues operating as before until complete grip is obtained or until the vehicle stops. An error may be shown in the event that the duration of the pressure reduction phase exceeds a predetermined time limit.

---

**ABS SYSTEM DESCRIPTION**

The ABS system is a device to avoid wheels locking in case of emergency braking, increasing vehicle braking stability when compared to a traditional braking system.

Sometimes when the brake is operated, the tyre locks with a consequent loss of grip, which makes it difficult to control the vehicle. A position sensor (3) on the tone wheel (2), forming an integral unit with the vehicle wheel, "reads" the status of the vehicle wheel spotting any possible lock.

A control unit (1) signals this out and adjusts the pressure in the braking circuit accordingly.

**NOTE**

WHEN THE ABS STARTS WORKING, A PULSING IS FELT ON THE BRAKE LEVER.

⚠️ THE WHEEL ANTILOCK BRAKING SYSTEM DOES NOT PREVENT FALLS WHILE ON A BEND. AN EMERGENCY BRAKING WITH THE VEHICLE INCLINED, HANDLE BAR TURNED, ON UNEVEN OR SLIPPERY ROADS, OR WITH POOR GRIP CREATES LACK OF STABILITY DIFFICULT TO HANDLE. THEREFORE, RIDE CAREFULLY AND SENSIBLY AND ALWAYS BRAKE GRADUALLY. BRAKING WHILE TURNING A CORNER IS SUBJECT TO LAWS OF PHYSICS WHICH NOT EVEN ABS CAN ELIMINATE.

When the sensors (3) detect a significant speed difference between the rear and the front wheels (for example, when rearing up on the back wheel), the ABS system could take this as a dangerous situation. In this case, there are two possible results:

- The ABS system intervenes by releasing pressure from the calliper until the wheel turns again at the same speed of the other wheel. It is not possible to brake for an instant.
- if the speed difference lasts long, the system may detect an error and deactivate the ABS system. As a consequence, the system works like any regular braking system.
Advanced functions - ABS

- This function allows you to disable the ABS system that is normally active "On".
- Briefly pressing the MODE selector in the middle deactivates the function ("Off") and pressing it again reactivates it ("reactivate").
- Disabling is possible only when the vehicle is in "OFF ROAD" mode. If the riding mode is changed, ABSreactivates.
- To return to the "MENU", briefly press the MODE selector in the middle on "Exit".

**CAUTION**
IT IS DISABLED ONLY TEMPORARILY, WHEN THE KEY IS INSERTED THE SYSTEM IS ALWAYS ACTIVE.

**CAUTION**
DISABLING IS POSSIBLE ONLY WHEN THE VEHICLE IS IN "OFF ROAD" MODE. IF THE RIDING MODE IS CHANGED, ABS REACTIVATES. IF DISABLED, THE ABS INDICATOR LIGHT STAYS ON STEADY.

- Upon starting the vehicle, after the initial instrument panel check, the ABS warning light flashes until a speed of 5 kph (3.11 mph) is exceeded and then it switches off or continues to flash even after exceeding the speed of 5 kph (3.11 mph).
- If the ABS warning light continues flashing or is permanently on, a failure has been detected and the ABS has been automatically deactivated.

**Characteristic**
Distance between tone wheel and front sensor
0.1 - 3.17 mm (0.004 - 0.125 in)

Distance between tone wheel and rear sensor
0.1 - 3.10 mm (0.004 - 0.122 in)
In OFF ROAD mode, the ABS system deactivates automatically for the rear wheel.

**CAUTION**
ONLY IN THIS MODE DOES THE ABS SYSTEM STAY ACTIVE EXCLUSIVELY FOR THE FRONT WHEEL AND THE DEDICATED SYMBOL APPEARS ON THE DISPLAY TO REMIND THE RIDER TO TAKE PARTICULAR CARE.

---

**Modulator**

**REMOVAL**

- Remove the engine from the vehicle

**PREPARING THE VEHICLE**

- Connect the bleeder bottles to the front and rear calliper bleeder screws and open them.
- Press the front brake lever and the rear brake pedal as far as they will go and block them in position using the clamping devices. Close the front and rear calliper bleeder screws and remove the bleeder bottle.
- Mark a reference on the pipes and on the ABS control unit to avoid inverting them when refitting.
- Undo and remove the screw (1)
- Undo and remove the screw (2)
• Remove the support bracket (3)

• Disconnect the connector (4)

• Unscrew and remove the screws (5)
• Remove the ABS control unit (6)

**NOTE**

**INSTALLATION**
• Remove the ABS modulator
• Install the new completely pre-filled ABS control unit
• In order to ensure that the brake fluid remains inside the ABS control unit, first remove the protective plugs from the braking circuit couplings and connect the corresponding lines.
• Once all the braking circuit lines have been connected, remove the protective plugs from the couplings of the brake master cylinders and connect the respective lines to the ABS control unit.
• Remove the clamp from the front brake lever and the rear brake pedal
• Remove the caps from the reservoirs and fill them with new brake fluid

**CAUTION**
PERFORM THE STANDARD BRAKING SYSTEM BLEEDING PROCEDURE, AS DESCRIBED AT THE END OF THE CHAPTER.
• Fill the reservoirs and refit the caps
• Check the stroke and sensitivity of the front brake lever and the rear brake pedal
• If the brake pedal or lever stroke is too long after carrying out the bleeding procedure, check the braking system for leaks and, if none are found, bleed the system using the diagnostic tool, as described.
• Disconnect the flexible bleeder pipes and re-tighten the bleeder screws, applying the correct torque

ABS CONTROL UNIT CONNECTOR INSERTION PROCEDURE
• Check the initial position of the connection clip lever.

• When the connector is fully inserted, the distance between the connector and the ABS control unit must be 7.5 mm (0.29 in).

• If the initial position of the connector and the driving lever is not that shown in fig. 1, the connector will not be properly coupled and the distance measured will be greater (12 mm approx. (0.47 in)). In this case repeat the operation as described in the two previous points.

IT IS ADVISABLE TO CREATE A TEMPLATE TO CHECK THE CORRECT CONNECTOR INSERTION.
Component maintenance

- The vehicle is equipped with two-channel ABS. In other words, it works on both the front and rear wheel. Periodically and each time the wheels are re-mounted, the phonic wheel or the sensor is replaced, it is important to check that the distance is consistent over all 360°. To do this, use a feeler gauge and check the distance between the sensor and the phonic wheel on three points at a distance of 120°.

**CAUTION**

If the readings should return a value outside of the field of tolerance, replace the sensor and/or the phonic wheel and repeat the check in order to ensure that the values fall within the field of tolerance.

**Characteristic**

Distance between tone wheel and front sensor
0.1 - 3.17 mm (0.004 - 0.125 in)

Distance between tone wheel and rear sensor
0.1 - 3.10 mm (0.004 - 0.122 in)

**CLEANING THE PHONIC WHEELS**

- It is important to check that both phonic wheels are always clean. If not: delicately remove any dirt residues using a cloth or wire brush. Do not use solvents or abrasive substances and do not direct air or water jets directly on the phonic wheel.

**REPLACING THE PHONIC WHEEL SENSOR**

- Disconnect the front phonic wheel sensor connector from the main wiring harness. Unscrew and remove the screws and remove the phonic wheel sensor.

**CAUTION**

V85 TT
Braking system

BRAK SYS - 171
BEFORE REFITTING, ENSURE THAT THE CONTACT SURFACES BETWEEN THE SENSOR AND THEIR SEATS ARE FREE OF IMPERFECTIONS AND PERFECTLY CLEAN. ALWAYS CHECK THE DISTANCE BETWEEN THE SENSOR AND THE PHONIC WHEEL.

Removal

- Connect the bleeder bottles to the caliper bleeder screw and open
- Press the lever down as far as it will go and block it in position using a clamping device in order to prevent the liquid from escaping from the system when it is open.
- Close the caliper bleeder screw and remove the bleeder bottle.
- Loosen the two grub screws (1)

- Free the brake calliper line from the cable grommet (2)

- Unscrew and remove the joint screw (3) from the rear calliper
- Unscrew and remove the screws (4)
Installing

- Remove the rear brake calliper
- Correctly position the new rear brake calliper (1) on the brake disc
- Insert and tighten the screws (2)
- Position the brake line, insert and tighten the screw (3)
- Hook the brake line into the cable grommet (4)
• Insert and tighten the two grub screws (5)

• Remove the clamp from the brake pedal.
• Remove the brake fluid reservoir cap and fill it with new brake fluid

**CAUTION**

**PERFORM THE STANDARD BRAKING SYSTEM BLEEDING PROCEDURE, AS DESCRIBED AT THE END OF THE CHAPTER.**

• Top up the fluid reservoir and refit the cap
• Check the stroke and sensitivity of the brake pedal
• If the brake pedal stroke is too long after carrying out the bleeding procedure, check the braking system for leaks and, if none are found, bleed the system using the diagnostic instrument, as described
• Disconnect the flexible bleeder pipes and re-tighten the bleeder screws, applying the correct torque

**Removal**

The following procedure is described for a single calliper, but is valid for both front brake callipers.

• Connect the bleeder bottles to the calliper bleeder screw and open
• Press the lever down as far as it will go and block it in position using a clamping device in order to prevent the liquid from escaping from the system when it is open.
• Close the calliper bleeder screw and remove the bleeder bottle.
• Unscrew and remove the joint screw (1) from the front calliper
• Unscrew and remove the two screws (2)
Installing

- Remove the front brake calliper (3)
- Correctly position the new front brake calliper (1) on the brake disc
- Insert and tighten the screws (2)
- Position the brake line on the brake calliper and insert and tighten the screw (3)
- Remove the clamp from the front brake lever.
- Remove the brake fluid reservoir cap and fill it with new brake fluid

CAUTION

PERFORM THE STANDARD BRAKING SYSTEM BLEEDING PROCEDURE, AS DESCRIBED AT THE END OF THE CHAPTER.

- Top up the fluid reservoir and refit the cap
- Check the stroke and sensitivity of the brake lever
- If the brake lever stroke is too long after carrying out the bleeding procedure, check the braking system for leaks and, if none are found, bleed the system using the diagnostic instrument, as described
• Disconnect the flexible bleeder pipes and re-tighten the bleeder screws, applying the correct torque

Disc Inspection

FRONT

CAUTION

THE FRONT BRAKE DISC SHAPE DOES NOT CHANGE THE OPERATING AND MAINTENANCE SPECIFICATIONS OF THE SYSTEM.

• The following operations must be carried out with the brake discs fitted on the wheel; they refer to a single disc, but are valid for both.

• Check the disc for wear by measuring the minimum thickness with a micrometer in different points. If the minimum thickness, even in a single point of the disc, is less than the minimum value, replace the disc.

Disc thickness minimum value: 4 mm (0.16 in)

• Using a dial gauge, check that the maximum oscillation of the disc does not exceed the tolerance; otherwise, replace it.

Disc oscillation tolerance: 0.15 mm (0.0059 in), with respect to the wheel centre line.

Removal

The following procedure is described for a single calliper, but is valid for both front brake callipers.

• Unscrew and remove the screws (1)
• Remove the front brake calliper (2) from the brake disc

• Remove the two retaining springs (3)

• Remove the two pins (4)

• Remove the spring (5)
Remove the brake pads (6) one at a time

**CAUTION**
AFTER REMOVING THE PADS, DO NOT OPERATE THE BRAKE LEVER OR THE CALLIPER PLUNGERS COULD GO OUT OF THEIR SEATS RESULTING IN BRAKE FLUID LEAKAGE.

---

**Installing**

The following procedure is described for a single calliper, but is valid for both front brake callipers

- Insert the new pads correctly (1)

**CAUTION**
ALWAYS REPLACE BOTH PADS AND MAKE SURE THEY ARE CORRECTLY POSITIONED INSIDE THE CALLIPER.

- Insert the spring (2)

- Insert the two pins (3)
• Insert the two retaining springs (4)

• Insert the front brake calliper (5) on the brake disc

• Insert the two screws (6) and tighten them

• Insert the front brake calliper (5) on the brake disc
• Insert the two screws (6) and tighten them

Removal

• Connect the bleeder bottles to the caliper bleeder screw and open
• Press the lever down as far as it will go and block it in position using a clamping device in order to prevent the liquid from escaping from the system when it is open.
• Close the calliper bleeder screw and remove the bleeder bottle.
• Loosen the two grub screws (1)

• Free the brake calliper line from the cable grommet (2)

• Unscrew and remove the two screws (3)
• Remove the rear brake calliper (4) from the brake disc

• Unscrew and remove the two grub screws (5).

• Remove the brake pads (6) one at a time

CAUTION
AFTER REMOVING THE PADS, DO NOT OPERATE THE BRAKE LEVER OR THE CALLIPER PLUNGERS COULD GO OUT OF THEIR SEATS RESULTING IN BRAKE FLUID LEAKAGE.

Installing

• Insert the new pads correctly (1)

CAUTION
ALWAYS REPLACE BOTH PADS AND MAKE SURE THEY ARE CORRECTLY POSITIONED INSIDE THE CALLIPER.
• Insert and tighten the grub screws (2)

• Insert the rear brake calliper (3) on the brake disc

• Insert and tighten the screws (4)

• Insert the brake calliper line into the cable grommet (5)
• Tighten the two grub screws (2)

Bleeding the braking system

PREPARING THE VEHICLE

• It is important to ensure that there is always a sufficient quantity of brake fluid in the tank.
• These operations may be simplified by using a bleeding device when carrying out the "Replacing the brake fluid" operations
• In this case, when performing the bleeding procedure, it is also necessary to operate the brake pedal a few times with the bleeder device connected (approximately five times for each wheel circuit).

FRONT/REAR BRAKE MASTER CYLINDER

PRELIMINARY OPERATIONS

• Replace the damaged brake master cylinder with a new one
• Connect the brake line to the new brake master cylinder
• Fill the reservoir with new brake fluid

CAUTION

PERFORM THE STANDARD BRAKING SYSTEM BLEEDING PROCEDURE, AS DESCRIBED AT THE END OF THE CHAPTER.

• Top up and refit the cap
• Check the stroke and sensitivity of the brake pedal and lever
• If the brake pedal or lever stroke is too long after carrying out the bleeding procedure, check the braking system for leaks and, if none are found, bleed the system using the diagnostic tool, as described.
• Disconnect the flexible bleeder pipes and re-tighten the bleeder screws, applying the correct torque

BLEEDING SYSTEM WITH DIAGNOSTICS INSTRUMENT

This type of bleeding has to be carried out if after all the checks the brake lever and the pedal are still spongy.

The operations described here are valid for both systems even though the description refers to the front system.
FRONT

• With diagnostics instrument properly connected, select the function "FRONT BRAKE BLEEDING PROCEDURE".
• The pump starts rotating.
• While the pump is performing a rotation cycle, operate and release the front brake lever until the message diagnostics instrument cycle completion is received.
• This procedure allows the air to turn and to accumulate.
• Once the procedure with diagnostics instrument is finished, perform the REGULAR BLEEDING to remove the air from the system completely.

CAUTION

PERFORM THE STANDARD BRAKING SYSTEM BLEEDING PROCEDURE, AS DESCRIBED AT THE END OF THE CHAPTER.

Front

Any air trapped in the hydraulic circuit acts as a cushion, absorbing much of the pressure applied by the brake pump and minimising the braking power of the calliper.

The presence of air is signalled by the "sponginess" of the brake and by poor braking.

---

IN VIEW OF THE DANGER THIS POSES FOR VEHICLE AND RIDER, THE HYDRAULIC CIRCUIT MUST BE BLED AFTER REFITTING THE BRAKES AND RESTORING THE BRAKING SYSTEM TO ITS NORMAL OPERATING CONDITIONS.

NOTE

THE FOLLOWING OPERATIONS REFER TO ONE FRONT BRAKE CALLIPER ONLY, BUT ARE VALID FOR BOTH. THE VEHICLE MUST BE ON LEVEL GROUND TO BE BLED. WHILE BLEEDING THE HYDRAULIC SYSTEM, FILL THE RESERVOIR WITH THE NECESSARY QUANTITY OF BRAKE FLUID. CHECK THAT, DURING THE OPERATION, THERE IS ALWAYS BRAKE FLUID IN THE RESERVOIR.

• Remove the rubber protection cover of the bleed valve.
• Insert the transparent plastic pipe in the front brake calliper bleed valve and slide the other end of this pipe in a container to collect the fluid.
• Remove the front brake fluid reservoir cap.
• Quickly press and release the front brake lever several times and then keep it fully pressed.
• Loosen the bleed valve by a 1/4 turn so that the brake fluid flows into the con-
tainer, this will release the tension on the brake lever, risking making it arrive at the end stop.

• Close the bleed valve before arriving at the end of the stroke with the lever.
• Repeat the operation until there are no air bubbles in the fluid going into the container.

**NOTE**

WHILE BLEEDING THE HYDRAULIC SYSTEM, FILL THE RESERVOIR WITH THE NECESSARY QUANTITY OF BRAKE FLUID. CHECK THAT, DURING THE OPERATION, THERE IS ALWAYS BRAKE FLUID IN THE RESERVOIR.

• Screw the bleeding valve and remove the pipe.
• Top-up the reservoir until the correct brake fluid level is obtained.
• Refit and block the front brake oil reservoir cap.
• Refit the rubber protection cover.

**Rear**

Any air trapped in the hydraulic circuit acts as a cushion, absorbing much of the pressure applied by the brake pump and minimising the braking power of the calliper.

The presence of air is signalled by the "sponginess" of the brake and by poor braking.

**CAUTION**

IN VIEW OF THE DANGER THIS POSES FOR VEHICLE AND RIDER, THE HYDRAULIC CIRCUIT MUST BE BLED AFTER REFITTING THE BRAKES AND RESTORING THE BRAKING SYSTEM TO ITS NORMAL OPERATING CONDITIONS. THE VEHICLE MUST BE ON LEVEL GROUND TO BE BLED. WHILE BLEEDING THE HYDRAULIC SYSTEM, FILL THE RESERVOIR WITH THE NECESSARY QUANTITY OF BRAKE FLUID. CHECK THAT, DURING THE OPERATION, THERE IS ALWAYS BRAKE FLUID IN THE RESERVOIR.

• Remove the rubber protection cover of the bleed valve.
• Insert the transparent plastic pipe in the rear brake calliper bleed valve and insert the other end of this pipe into a container to collect the fluid.
• Remove the rear brake fluid reservoir cap.
• Repeatedly quickly pull and release the rear brake lever, then keep it fully pulled.
• Loosen the bleed valve by a 1/4 turn so that the brake fluid flows into the container, this will release the tension on the brake lever, risking making it arrive at the end stop.
• Close the bleed valve before arriving at the end of the stroke with the lever.
• Repeat the operation until the are no air bubbles in the fluid going into the container.

**NOTE**
WHEN BLEEDING THE HYDRAULIC SYSTEM, FILL THE TANK WITH BRAKE FLUID WHEN NECESSARY CHECK THAT DURING THE OPERATION THERE IS ALWAYS BRAKE FLUID.

• Screw the bleeding valve and remove the pipe.
• Top-up the reservoir until the correct brake fluid level is obtained.
• Refit and lock the rear brake oil reservoir cap.
• Refit the rubber protection cover.

**Removal**

• Undo and remove the joint screw (1) from the front brake master cylinder after placing a suitable container underneath to collect the brake fluid
• Unscrew and remove the screws (2)

• Remove the U-bolt (3)

• Unscrew and remove the two screws (4)

• Remove the sensor (5) from the front brake master cylinder
• Remove the front brake master cylinder (6)

Rimozione

• Unscrew and remove the two screws (1)

• Remove the protection cover (2)

• Undo and remove the joint screw (3) from the rear brake master cylinder after placing a suitable container underneath to collect the brake fluid.
• Remove the rear brake master cylinder (4)

REAR BRAKE FLUID RESERVOIR REMOVAL
• Remove the rear brake master cylinder
• Undo and remove the screw (1)
• Retrieve the support bracket (2)
• Remove the hose guide (3)
• Remove the brake fluid reservoir (4)

REMOVING THE REAR MASTER CYLINDER PLUNGER
• Slide out the O-ring gasket (1) to free the locking clip

• Remove the locking clip (2)
• Remove the rear brake master cylinder plunger (3)

## Side fairings

**REMOVAL**

The following procedure is described for a single side bumper, but is valid for both side bumpers.

- Undo and remove the screw (1)
- Remove the side bumpers (2)

## Rear rack

**LUGGAGE RACK COVER REMOVAL**

- Holding the nuts still located on the lower part of the area indicated in the figure, loosen and remove the screws (1)
• Remove the luggage rack cover (2)

LUGGAGE RACK REMOVAL

• Unscrew and remove the screws (1)

• Unscrew and remove the screws (2)

• Remove the luggage rack (3)
Hand guards

REMOVAL
The following procedure is described for a single handguard, but is valid for both handguards.

- Remove the rear view mirrors
- Undo and remove the screw (1)

- Remove the handguards (2)

- Retrieve the counterweight (3)

Driving mirrors

REMOVAL
The following procedure is described for a single rear view mirror, but is valid for both mirrors.

- Remove the rubber piece (1)
• Holding the locknut (2) so it cannot rotate, loosen the nut (3)

• Remove the rear view mirror (4)

• Undo and remove the locknut (2)

Instrument panel

REMOVAL

• Remove the headlight
• Unscrew and remove the screws (1)
• Disconnect the connector (2)

• Remove the instrument panel (3)

Headlight assy.

REMOVAL

• Remove the top fairing
• Unscrew and remove the screws (1)

• Unscrew and remove the screws (2)
• Remove the cover (3).

• Remove the connector (4) from the support as indicated in the figure.

• Disconnect the connector (4).

• Undo and remove the screw (5).
• Undo and remove the screw (6)

• Undo and remove the screw (7)

• Remove the wiring as indicated in the figure

• Remove the front light assembly (8)
• Retrieve the bushings (9)

Horn

REMOVAL

• Disconnect the connectors (1)
• Undo and remove the screw (2)
• Remove the horn (3)

Turn indicators

REMOVING FRONT TURN INDICATORS

• Remove the top fairing
• Disconnect the left turn indicator connector (1)

• Disconnect the right turn indicator connector (2)
• Unscrew and remove the screws (3) from both sides of the vehicle

• Remove the front turn indicators (4) from both sides of the vehicle

---

**REAR TURN INDICATORS REMOVAL**

• Block the nuts (1) so that they cannot rotate and unscrew and remove the screws (2)

• Remove the rear turn indicators (3)
Headlight fairing

REMOVAL

• Unscrew and remove the screws (1)

• Remove the top fairing (2)

TOP FAIRING BRACKET REMOVAL

• Unscrew and remove the screws (1)

• Unscrew and remove the screws (2)
Disassembling the lock

REMOVAL

• Remove the licence plate holder bracket
• Unhook and remove the wire (1) from its seat

• Remove the wire (1) from the point indicated in the figure

• Remove the plate (2)
• Remove the saddle lock (3)

Taillight assy.

• Remove the licence plate holder bracket
• Unscrew and remove the screws (1)

• Remove the rear light assembly (2)

License plate light

REMOVAL

• Remove the licence plate holder bracket
• Undo and remove the screw (1)
Footrest

REMOVING THE PASSENGER FOOTRESTS

The following procedure is described for a single footrest, but is valid for both passenger footrests.

- Remove the snap ring (1)

- Remove the pin (2)

- Remove the passenger footrest (3)
Retrieve the two plates (4), the sphere (5) and the spring (6)

REMOVING THE PASSENGER FOOTREST SUPPORT
The following procedure is described for a single bracket, but is valid for both passenger footrest brackets.

- Unscrew and remove the two screws (1)

- Remove the passenger footrest bracket (2)

RIDER FOOTREST REMOVAL
The following procedure is described for a single footrest, but is valid for both rider footrests.

- Remove the snap ring (1)
• Remove the pin (2)

• Remove the rider footrest (3)

REMOVING THE GEAR SHIFT LEVER

• Remove the safety clip (1) from the gear shift lever

• Remove the gear shift lever from the spherical joint (2)
• Undo and remove the screw (3)

• Remove the gear lever (4)

• Retrieve the bushing (5) and the two O-rings (6)

REMOVING THE REAR BRAKE LEVER

• Holding the nut (2) so that it cannot rotate, remove the screw (1)
• Remove the rear brake lever (3)

• Retrieve the nut (2) and the washer (4)

• Retrieve the bushing (5) and the two O-rings (6)

RIGHT RIDER FOOTREST BRACKET REMOVAL

• Remove the rear brake master cylinder, brake master cylinder plunger and front brake lever
• Undo and remove the screw (1)
• Undo and remove the screw (2)

• Undo and remove the screw (3)
• Retrieve the bushing (4)

• Undo and remove the screw (5)
• Retrieve the bushing (6)

• Hold the nut (7) from the opposite side so that it cannot rotate and remove the screw (8)
• Rotate the plate 180°, undo and remove the screws (9) and remove the bracket (10)

• Undo and remove the screw (11) and remove the sensor (12) from the bracket

• Remove the right rider footrest bracket plate (13)
• Remove the passenger footrest bracket

**LEFT RIDER FOOTREST BRACKET REMOVAL**
• Remove the safety clip (1)
• Remove the gear shift lever from the spherical joint (2)

• Undo and remove the screw (3)

• Undo and remove the screw (4)

• Undo and remove the screw (5) and retrieve the bushing (6)
• Undo and remove the screw (7) and retrieve the bushing (8)

• Holding the screw (9) from the opposite side so that it cannot rotate, undo and remove the nut (10)

• Rotate the plate 180° and remove the two cable grommets (11)

• Remove the left rider footrest bracket plate (12)
Side body panels

REMOVAL
The following procedure is described for a single side panel, but is valid for both side panels.

- Remove the glove compartment
- Unscrew and remove the screws (1)
- Remove the side fairing panel (2)

Glove-box

REMOVAL

- Remove the saddle
- Unscrew and remove the screws (1)
- Remove the fuses (2) from the support indicated in the figure
• Remove the glove compartment (3)

Side fairings

REMOVAL

• Remove the fuel tank
• Unscrew and remove the screws (1)

• Unscrew and remove the screws (2)

• Unscrew and remove the screws (3)
• Unscrew and remove the screws (4)

• Remove the left side engine fairing (5)

• Remove the right side engine fairing (6)

Fairing mounting panels

REAR BRAKE HOSE GUIDE REMOVAL

• Undo and remove the screw (1)
• Undo and remove the screw (2)

• Remove the cable grommet (3)

• Remove the rear brake hose guide (4)

UNDER-SADDLE COMPARTMENT/BATTERY BOX REMOVAL

• Remove the side fairing panels
• Remove the licence plate holder bracket
• Remove the fuse box (1)
• Unscrew and remove the screws (2)

• Unscrew and remove the screws (3)

• Unscrew and remove the screws (4)

• Unscrew and remove the screws (5)
- Remove the under-saddle compartment/battery box (6)

**License plate holder**

**LICENCE PLATE HOLDER BRACKET REMOVAL**

- Remove the luggage rack
- Unscrew and remove the screws (1)

- Unscrew and remove the screws (2)

- Support the licence plate bracket
- Unscrew and remove the screws (3)
• Remove the licence plate bracket cover (4)

• Remove the wiring from the cable glands (5)

• Remove the wiring from the cable glands (6)

• Disconnect the right turn indicator connector (7)

• Disconnect the left turn indicator connector (8)
• Disconnect the connector (9)

• Remove the licence plate light (10)

• Remove the licence plate holder (11) complete with rear light assembly and rear turn indicators
  • Remove the rear light cluster
  • Remove the rear turn indicators

Air box

REMOVAL
• Remove the saddle
• Remove the glove compartment
• Remove the side fairing panels
• Unhook and remove the four springs (1) located around the airbox filter, two in the upper area, one on the left side and one on the right side
• Remove the filter box (2)

• Unscrew the screws (3)

• Unscrew and remove the screws (4)

• Loosen the clamp (5)
• Disconnect the pipe (6)
• Remove the plastic rivet (7)
• Unscrew and remove the screws (8)

• Disconnect the connector (9)
• Momentarily remove the support bracket (10) from the frame

• Loosen the clamp (11)
• Disconnect the pipe (12)

• Disconnect the connector (13)
• Remove the filter box cover (14) complete with throttle body
• Slide the throttle body out and remove it

Sump guard

REMOVAL
• Unscrew and remove the screws (1)
• Remove the sump guard (2)

Fuel tank

• Remove the ignition switch assembly gasket (1)
• Undo and remove the screw (2)
• Undo and remove the screw (3)

• Remove the ignition switch assembly cover (4)

• Unscrew and remove the screws (5)

• Undo and remove the screw (6)
- Disconnect the connector (7)

- Disconnect the fuel pump hose (8)

- Loosen the clamp (9) and disconnect the hose (10)

- Lifting the front part of the fuel tank, loosen the clamp (11) and disconnect the hose (12)
• Remove the fuel tank (13)

TANK FILLER CAP REMOVAL
• Open the tank filler cap
• Unscrew and remove the screws (1)

• Remove the tank filler cap (2)

CENTRAL TANK FAIRING REMOVAL
• Undo and remove the screw (1)
• Unscrew and remove the screws (2)

• Undo and remove the screw (3)

• Unscrew and remove the screws (4)

• Remove the central tank fairing (5)
Front mudguard

REMOVAL

• Unscrew and remove the nuts (1)

• Remove the cable grommets from both sides of the mudguard (2)

• Remove the complete front mudguard (3)

• Retrieve the bushings (4)
• Unscrew and remove the screws (5)

• Remove the mudguard cover (6)

• Undo and remove the screws (7)

• Remove the grille (8)
Instrument cluster support

REMOVAL

- Remove the instrument panel
- Unscrew and remove the screws (1)

- Remove the instrument panel bracket (2)

- Remove the connector (3) from the guide indicated in the figure
- Disconnect the connector (3)

- Remove the plastic rivet (4)
- Remove the plastic rivets from both sides of the vehicle (5)

- Unscrew and remove the screws (6)

- Remove the support (7)

- Remove the USB socket (8)
- Remove the connector (14) from the guide indicated in the figure
- Disconnect the connector (14)

- Remove the main wiring harness (15) from the bracket

- Remove the support (16)

- Remove the clamp (17)
- Remove the air temperature sensor (18)
**Battery**

**REMOVAL**

- Remove the glove compartment
- Undo and remove the screw (1)
- Remove the negative cable from the battery (2)
- Refit the screw (1) along with the yoke in the specific seat

- Lift the protective boot (3)
- Undo and remove the screw (4)
- Remove the positive cable (5)
- Refit the screw (4) along with the yoke in the specific seat

- Remove the battery (6)

**Tail guard**

**REAR FAIRINGS REMOVAL**

- Remove the luggage rack
- Unscrew and remove the screws (1)
- Unscrew and remove the screws (2)
• Remove the rear fairing (3)

• Undo and remove the screw (4)

• Remove the right rear fairing (5)

• Undo and remove the screw (6)
• Remove the left rear fairing (7)

Copertura terminale

REMOVAL

• Unscrew and remove the screws (1)

• Remove the left cover (2)

• Unscrew and remove the screws (3)
• Remove the terminal cover (4)

• Retrieve the washers (5)
## INDEX OF TOPICS

Specific operations for the vehicle

**WINDSHIELD KIT ASSEMBLY**

- The box containing the windshield is in the vehicle packaging. The installation hardware is mounted on the windshield bracket assembled to the vehicle.
- Installation begins with the removal of the mounting hardware from the windshield bracket (for each of the four fastening points, made up of: rubber piece, bushing and screw).
- Subsequently, the four rubber pieces (1) are fitted in the respective holes on the windshield, avoiding the use of tools that can damage or scratch the component.
- The bushings (2) should be inserted in the holes of the rubber pieces from the front side of the windshield.
- The windshield should then be rested on the relative bracket on the vehicle and, supporting it firmly, the screws should be fastened (3), tightening them to the torque indicated on the chart.

![Windshield Kit Assembly Diagram]

**WINDSHIELD KIT TIGHTENING TORQUES**

<td>8 Nm (5.90 lbf ft)</td>
</tr>
</tbody>
</table>

**HANDGUARDS AND REAR VIEW MIRRORS KIT ASSEMBLY**

- The box containing the right and left handguards, the anti-vibration weights and the hardware required for assembling the aforementioned components is in the vehicle packaging.
- There is also a box containing the rear view mirrors.

![Handguards and Rear View Mirrors Diagram]
• Installation of the handguards begins with the insertion of the rubber piece (1) in the specific cylindrical lodging on the internal side of the handguards.

• Then, rest the anti-vibration weight (2) in correspondence to the end of the handlebar and on this handguard (3), taking care to line up the inside with the shape of the anti-vibration weight; then, the “T” bushing (4) should be inserted on the handguard and the screw (5) inserted without tightening it all the way.

• Then, insert the other “T” bushing from below on the second handguard fastening hole and screw in the rear view mirror (6)

• Then, tighten the screw (5), observing the tightening torque indicated on the attached chart.

• Repeat the same procedure to mount the handguard/rear view mirror on the opposite side.

### BATTERY COVER ASSEMBLY

• Remove the saddle, acting on the lock positioned on the licence plate holder and lift it from the rear part, unhooking it from its lodgings in correspondence to the fuel tank.

• Remove the screws (1) and extract the battery cover (2) from the front lodgings, sliding it toward the rear.
- Place the battery in the appropriate lodging and connect it, taking care to observe the polarity.
- Refit the battery cover, inserting it in the appropriate lodgings as indicated in figure "C".
- Insert the screws (1) in the appropriate holes, observing the tightening torque indicated on the attached chart.
- Refit the saddle, hooking it in the front part in the appropriate lodgings in correspondence to the fuel tank and lower it at the rear, ensuring that the saddle lock has clicked.
